"Therapeutic Results Using Some Modern Anabolic Steroid Hormones."

Prague, Casopis Lekarů Ceskych, Vol 102, No 42, 1963, pp 1148-1154

Abstract: [Authors' English abstract modified] Results with treatment of 55 patients using Dianabol and Durabolin are given. Diseases treated included burns, asthenia, disturbances of growth, duodenal ulcers, osteoporosis. Most rapid gain in weight was due to Dianabol, lowest consumption per unit weight gained was due to Durabolin. Comparison tests with testosterone were made. Anabolic hormones improve general condition, accelerate healing, inhibit catabolic effect of functional hypercorticalism. Improvement was noticed in cardiac patients showing poor reaction to cardiotonic treatment.

1694. TONSILLECTOMY AND ADENOTOMY IN TUBERCULOUS LYMPHOMAS OF THE NECK IN CHILDREN - Tonsilektómia a adenotómia pri krčných tuberkulózných lymfómoch detstvom veku - Kľaňanský I., Bresa J. and Thursova M. Otorinolaryng. Odd. Detskéj Fak. Nemocnice, Bratislava - BRATISL. LEK. LISTY 1958, 28 (II)/2 (87-90)

Favourable results of tonsillectomy and adenotomy in 28 children with tuberculous lymphomas of the neck led to the opinion that these operations are indicated in all cases of tuberculous lymphoma in children where no improvement is observed after the usual antituberculous treatment. They should also be carried out in children with minimal tonsillar symptoms, especially when no further tuberculous focus is demonstrable beside lymphomas of the neck.

AUTHOR: Klacek, Jan, Engineer

TITLE: A simple regulated power source

PERIODICAL: Sdēlovaci technika, no. 11, 1960, 428 - 429

TEXT: The Department for Applied Radio Engineering of the Radio-Engineering Division in Poděbrady developed a regulated power source, using a saturated diode (Fig. 3). It consists of a tungsten-filament diode (E_1), the plate voltage of which is supplied from the main source (ZH). In this source, it is sufficient to use a half-wave rectifier. The heating voltage is supplied by the heating transformer (TR) which has the working coil of the transducer (T) connected in series with its primary winding. The transducer reactance is controlled by direct bias, originating from the d-c flow through the control winding. The d-c is supplied by the regulating tube (E_2). The anode voltage of this tube is supplied by the auxiliary source (PZ1). Changes of the supplied d-c are achieved by changes of the grid bias, which is supplied by the auxiliary source (PZ2). Terminals (2) serve the connection of a load, the resistor (R_m) measures losses originating at various currents. An "LV 3" tube (product of Marconi) was used as working tube (E_1). This tungsten filament (14 v filament voltage) triode was con-

A simple regulated power source

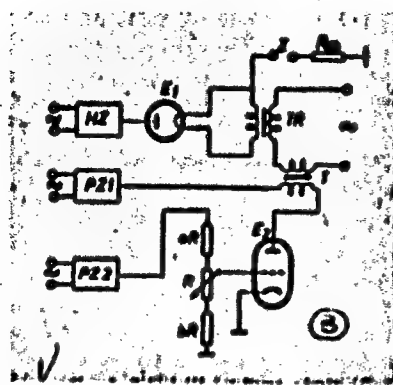

nected as a diode and supplied a current of 3×10^{-1} to 2×10^{-8} amp. infinitely variable over the entire range. A voltage of 700 v of the main source was sufficient at a maximum loss of 200 v at the load. At 20 v, connected in series with the load, the adjusted current does not change more than $\pm 1\%$. Influences of grid fluctuations (-15 to + 10%) can be reduced to a maximum of 0.5% when the entire source is supplied over a "Křizik ST 500" grid regulator. The instrument described has the advantage that even very low currents (10^{-8} amp) can be obtained; however, unfavorable is the high anode voltage required for saturation of the working tube. The use of a tube as saturation d-c source increases also the otherwise low susceptibility of the instrument to break-down. The instrument is especially suitable for precise testing of discharge tubes and thyratrons. There are 5 figures and 2 Czechoslovak references.

TITLE: Determination of the composition of vinyl chloride and vinyl acetate copolymer:

PERIODICAL: Referativnyy zhurnal. Khimiya, no. 19, 1962, 506, abstract 19r9 (Kaučuk a plast. hmoty, no. 8, 1961, 258-261 [Czech.])

TEXT: A rapid and easy method has been developed for determining vinyl chloride and vinyl acetate (I) in copolymers of vinyl chloride and I. The sample was dissolved in a mixture of methanol and water (1:1), then the copolymer was separated, dried, homogenized, and analyzed. Chlorine was determined by the modified Schöniger method (a weighed portion ~ 0.1 g is burned, with argentometric titration of the chlorides). The I content in the copolymer was determined by IR spectroscopy and the intensity of the 1750 cm^{-1} absorption band, which is characteristic of carbonyl groups, was measured. [Abstracter's note: Complete translation.]

TITLE: Experimental rockets 13

SOURCE: Letecky obsor, no. 11, 1964, 335

TOPIC TAGS: meteorological rocket, rocket guidance system, rocket parachute
 release, atmospheric research

ABSTRACT: Brief descriptions are given of two Czechoslovak meteorological rockets: the STA 3 which was lofted on Oct. 3, 1962 and the SUP-1 which was lofted on Dec. 20, 1963. The first weighed 6.45 kg with fuel, was 1050 mm long and climbed to 1,100 m at a maximum speed of 170 m/sec. The second weighed 18.1 kg with fuel, was 200 cm long, developed 260 kp thrust and a maximum speed of 120 m/sec. in vertical flight. Diagrams in the article show the relative position of the parachute release timer, parachute locker, electronic apparatus, rocket motor, stabilizer fins, antennas, casing, reserve timer for the parachute, accelerometer and recorder, guidance system recorder, gyroscopes and electronic amplifier, servo-motor, guidance fins, and batteries in the SUP-1. Orig. art. has: 2 photographs.

 TITLE: Development and Metamorphosis of *Rana esculenta*
Tadpoles as Affected by Uranium Nitrate. (Vliyaniye
azotnokislologo urana na razvitiye i metamorfoz golovastikov
selenoy lyagushki)
 PERIODICAL: Doklady AN SSSR, 1957, Vol. 115, Nr 6, pp. 1217-1219
 (USSR)

ABSTRACT: Although the biological part played by microelements was already sufficiently investigated in publications, the importance of uranium as microelement is for living creatures only little studied. The highest content of uranium compounds exists in the thyroid gland. Uranium was also found in the embryonal organs of man. In connection with the fact first mentioned the author decided to examine the influence of uranium, as mentioned in the title. The water of the breeding vessels contained 1 to 200 mg of uranium nitrate in 7 graduations per 1 liter. As criterion of the influence served: 1) Appearance of the bilateral symmetry in tadpoles and their liberation from the surrounding mucilage. 2) The moment of the

CARD 1/4

Development and Metamorphosis of *Rana esculenta* Tadpoles 20-6-45/48
as Affected by Uranium Nitrate

transition to free movement and 3) the surviving of the developed tadpoles. 10 days tests showed that uranium is not indifferent for the animals. Although the development of the bilateral symmetry was not impaired, the transition to free movement was markedly accelerated and the capability of resistance of the test animals in later stages was increased. They survived longer even at higher temperatures of environment (30-32°C) and were still alive for a long time, when the control tadpoles had already died. This was confirmed by repeated tests. As the capability of resistance is closely connected with metabolism processes that are due to the nervous and endocrinous system, the problem rose which type of influence was exerted by the thyroid gland. Therefore the authors decided experimentally to determine the influence of various uranium concentrations on the metamorphosis of tadpoles. After 17 days the control tadpoles died, probably due to the high temperature of environment (31°C). After 10 days, just as the test

CARD 2/4

Development and Metamorphosis of Rana esculenta Tadpoles 20-6-45/48
as Affected by Uranium Nitrate

function. In the case of the artificial metamorphosis under the influence of thyroxine its action is not suppressed but increased by thio-urea. It may be assumed that in the case under review uranium is in its action equal to thio-urea. There are 1 table and 4 Slavic references.

dosavadní zkušenosti s léčením basilární meningitidy. Our experiences
up to date in the treatment of tuberculous meningitis
PEDIAT. LISTY 1954, 9/1 (22-24)**

Between 1948 and 1952, 177 children aged 5 months to 16 yr. were treated. In 63 cases the diagnosis has been proved by finding M. tuberculosis in the CSF. At the beginning streptomycin alone has been used, later in combination with PAS. During the first year, when the treatment was insufficient and delayed, the mortality reached 94%, but in the last 3 yr. a mortality of 48% was attained. The greatest mortality was in earliest infancy and it decreased as age increased. In complicated cases the mortality was greater; in disseminated military forms 65%, in cases with pulmonary lesions 50%, but in uncomplicated only 33%. There were 12 relapses, from which 3 survived the 2nd attack but none the 3rd. Toxic effect of treatment (total deafness) was observed in 5 cases with prolonged medication, 4 times in relapses. When the treatment was started in the first week of illness a mortality of 57% was observed in comparison with 90% in cases treated first in the 4th week.

2331. THE ORGANIZATION OF THE TREATMENT OF TUBERCULOUS MENINGITIS IN CZECHOSLOVAKIA AND THE RESULTS OF TREATMENT - Organisation du traitement de la méningite tuberculeuse en Tchécoslovaquie et résultats obtenus - Kladivova L., Voltek V. and Sykora F. Sanat. Sumperk - ARCH. FRANC. PEDIAT. 1958, 15/7 (841-846)

All children with tuberculous meningitis in Czechoslovakia are transferred for treatment to one of 5 main centres which have been established for this purpose. They are fully staffed with all medical specialties needed for their management. The total number of children admitted during 1954 was 284, in 1955 252 and in 1956 226. The fall in the numbers during the 3 yr. was entirely accounted for by the decreasing incidence in the disease in children under 3 yr. of age (101 in 1954, 44 in 1955) and is attributed to the compulsory BCG vaccination. There were, however, 34 children during the 3 yr. who contracted meningitis after BCG vaccination (4.5% of all cases of meningitis). During 1954 the mortality from meningitis was 42% (120 deaths), in 1955 30% (78 deaths), and in 1956 18% (40 deaths). Bacteriological confirmation of the diagnosis was only available in 40% of the cases. A little more than half of the patients were conscious on admission. Children under 2 yr. on admission had a poorer prognosis. Among the survivors 46 have gross mental and neurological defects, 18 are deaf and 15 are blind. Lesser sequelae are seen in 202 patients and, finally, out of a total of 763 admissions 244 have no sequelae. In 1954 all patients had intrathecal streptomycin treatment; in 1955 20% and in 1956 75% had systemic treatment alone. In 1956 ACTH was used as an adjuvant, otherwise the treatment was the same throughout. This consisted of oral isoniazid (15-20 mg./kg. daily), i.m. streptomycin (20-40 mg./kg.) plus PAS for 6 months.

Authors : Tager, P. G., Dr. Tech. Sci.

Title : Present and future television

Periodical : Nauka i zhizn' 21/12, 44-45, Dec 1954

Abstract : A book entitled, "Television", by K. Kladkov is reviewed. The book recounts the development of television and stresses the role played by Soviet scientists, besides speculating about the future of television. However, in its technical parts the book contains some untrue statements, such as that a spark between electrodes can be better produced in a vacuum. Illustration.

Title : The Physical Parameters of the Aqueous Homogeneous Reactor as Functions of Temperature and Reflector Thickness.

Orig Pub : Repts. "J. Stefan" Inst., 1956, 3, 5-30

Abstract : The authors calculate the critical radius in mass for spherical homogeneous reactor of zero power with uranium enriched to 20% (UO_2SO_4 compound) with moderator. These calculations have been carried out for various infinite reflectors (ordinary and heavy water, graphite) and for various finite thickness of reflector made of heavy water in the temperature range from 25 to 200° C. The effect of thickness of the reflector made of heavy water on the reactivity has been determined for the case of an infinite cylinder. It turns out that at zero power the critical dimensions of a spherical reactor with finite reflector of heavy water are less

Title : Two-Group Calculation of the Temperature Dependence of the Physical Parameters of the Light Water Homogeneous Reactor.

Orig Pub : Repts. "J. Stefan" Inst., 1957, 4, 85-88

Abstract : It is shown that an homogeneous reactor with an aqueous solution of UO_2SO_4 (20% enrichment) can be regulated reliably and shut down by changing the level and by total emptying of the water from the container of the reflector in the temperature range from 25 to 250° C. Results of two-group calculations of a spherical reactor with infinite water reflector is carried out in active-zone and reflector temperatures of 25, 100, 200, and 250° C. Curves are given for the dependence of the two-group

Title : The Influence of a Breeding Reflector on the Critical Dimensions of the Homogeneous Suspension Reactor at Different Temperatures

Orig Pub : Repts. "J. Stefan" Inst., 1958, 5, 25-28

Abstract : A reactor is considered with a breeding reflector: the active zone is a suspension of enriched (20%) UO_2 in ordinary water, the reflector is a suspension of natural UO_2 in ordinary water. The dimensions of the suspended are neglected and the reactor is considered homogeneous. On the basis of the two-group theory in the diffusion approximation, the critical dimensions and mass of U^{235} are calculated for different temperatures

Orig Pub : Zh. microbiol., epidemiol. i immunobiologii, 1956 (1957), prilozheniye, 57.

Abstract : In rabbits that had been immunized 5 times with horse serum (5 ml after 2-3 days), the titer of complement fell immediately after a shocking dose of antigen and was restored in 1 hour 45 min. - 33 hours. Following anaphylactic shock induced 3-5 min. after ether anesthesia, a fall in the titer of complement was observed for 9 - 33 hours. In anaphylaxis reproduced under prolonged anesthesia (15-60 min.) the titer of complement was restored in 12-32 hours.

TITLE: CoPrecipitation of Nickel with Aluminium Hydroxide in Cadmium-Sulphate Solutions. I. Study of Conditions for CoPrecipitation. (Soosashdenie Nikelya s Gidrookis'yu Alyuminiya v Rastvorakh Sernokislovo Kadmiya).

PERIODICAL: "Zhurnal Neorganicheskoy Khimii" (Journal of Inorganic Chemistry) Vol.11, No.2, pp.452-455. (U.S.S.R.).

ABSTRACT: Experiments have been carried out to explore the possibility of separating nickel from cadmium-sulphate solutions containing NiSO_4 as impurity. Precipitation was carried out at 80°C , the precipitate was filtered off after standing at the same temperature for 1 hour and the concentration of unprecipitated nickel in the filtrate was determined photocolometrically. The filtrate had a pH value of 6.25. Precipitation was carried out by adding the calculated quantity of aluminium sulphate and cadmium hydroxide (as a suspension).

It was found that nickel could easily be separated by coprecipitation with aluminium hydroxide from cadmium-sulphate solutions containing 100 grams per litre cadmium and 50, 250 and 500 mg. per litre nickel. The amount of nickel coprecipitated depends on its concentration in the CdSO_4 solution and also on the quantity of aluminium sulphate and cadmium hydroxide introduced into this solution. The most complete removal of nickel

Card 1/2

584
CoPrecipitation of Nickel with Aluminium Hydroxide in Cadmium-Sulphate Solutions. I. Study of Conditions for CoPrecipitation. (Cont.)

(98.4%) is obtained under the following conditions: nickel concentration 500 mg. per litre, nickel: Al ratio equals 1 : 4, 1.5-fold quantity of $\text{Cd}(\text{OH})_2$, duration of precipitation 30 mins. and temperature of solution 80°C .

There are three references, two of them Russian.

There are eight tables.

The work was carried out at the Institute of General and Inorganic Chemistry of the Academy of Sciences of the Ukrainian SSR.

give a deposit with varying Mn content. The electrolyte exists in different stages of oxidation. Intermittent oxidation of the Mn in the electrolyte by a current of air through it reduced the effect of time. The Mn²⁺ was oxidized as a soln. of MnO₂ in Na citrate acidified to a pH of 4.7 with nitric acid and finally made anhydrous to precipitate the Mn. X-ray analyses of the plate indicated the presence of a homogeneous phase of Mn²⁺ whereas that with Mn³⁺ indicated a solid solution of Mn³⁺ on Ni and an unidentified solid phase.

AUTHORS: Grisevich, A. N., and Kladnitskaya, K. B.
TITLE: Rapid determination method of low amounts of copper in zinc and cadmium

PERIODICAL: Zavodskaya laboratoriya, v. 27, no. 11, 1961, 1343-1345

TEXT: In the present paper, a rapid determination method of low amounts of copper in pure zinc and cadmium was developed. It is based upon the extraction of copper in the form of its diethyl dithiocarbamate complex by carbon tetrachloride. The extraction is conducted at a pH of 4.5 - 5.0 to prevent the formation of basic zinc or cadmium salts. The yellow coloring of copper diethyl dithiocarbamate solutions in carbon tetrachloride is very stable. It is used for the photometric determination of copper in an FEK-M (FEK-M) photocolormeter with a blue filter (closed bulb). Concentrated solutions of zinc or cadmium salts, from which copper was removed by sodium diethyl dithiocarbamate addition and carbon tetrachloride extraction, were used for calibration. Certain amounts of a standard copper solution were then added to the purified solutions. This method

Card 1/3

Rapid determination method of low ...

S/032/61/027/011/002/016
B106/B110

of determining copper by sodium diethyl dithiocarbamate is possible without separation of the bulk (zinc or cadmium) since the copper carbamate complex is much more stable than the corresponding zinc or cadmium complexes and thus forms in the first place. Furthermore, colored iron, nickel, or cobalt carbamate complexes do not form in the presence of zinc or cadmium salts since the sodium diethyl dithiocarbamate excess is bound to colorless complexes by zinc or cadmium. Iron, however, is not completely masked by zinc. In the presence of zinc and low amounts of citric acid, iron does not disturb the above mentioned copper determination. The authors also studied the effects of zinc and cadmium concentrations, and of the aqueous phase volume, upon the completeness of copper extraction. Since the quantitative extraction of the copper carbamate complex from 200 milliliters of the aqueous phase by 10 milliliters of CCl_4 is possible even at 100 g/liter concentration of zinc or cadmium, weighed samples of up to 20 g can be analysed in this manner. For a 10 g sample, the sensitivity of the above method is $3 \cdot 10^{-5}\%$. The determination after dissolution of the sample takes about 10 minutes, the absolute error of determination is 10.5%. The method was tested on zinc sample no. 73

TITLE: Electrochemical production of pure cadmium

PERIODICAL: Zhurnal prikladnoy khimii, v. 34, no. 8, 1961.
1764-1769

TEXT: The present paper describes experiments carried out in a glass electrolytic cell of 1 liter capacity using CdSO_4 as electrolyte. Two anodes, cast from commercial Cd Kd-0 containing considerable impurities (shown in Table 1), and a Cd cathode of metal containing small amounts of metals which separates at potentials more negative than that of Cd separation (i.e. Ni, Fe and Zn) were used. With optimum conditions for electrolysis (D_k of 100 A/m^2 , temp. 35°C, period of 8 hours) about 0.7 kg Cd was produced. Table 1 shows relevant data on the purity of the Cd produced and it is clear that the use of a flowing electrolyte with external intermediate purification substantially reduces the Cu and Pb contents of cathode

Card 1/3

25226

S/080/61/034/008/009/018
D204/D305

Electrochemical production...

residues. Methods of purifying CdSO_4 solutions from Cu were studied. The solution was passed through a column of Cd cuttings at a certain speed and was also agitated with Cd cuttings. The Cd cuttings were first treated by agitation with dilute H_2SO_4 to remove oxide film and basic salts. Optimum conditions for purifying the solution by Cd metal are: S/V 1.6, duration 30 - 60 mins; temperature 18 - 20°C, acidity (minimum) 0.5 g/l H_2SO_4 . With these conditions, the Cu content can be reduced to 0.02 - 0.03 mg/l, the degree of purification being independent of the Cd content of the solution. After purification from Cu, the acid solution was purified from Pb by co-precipitation with SrSO_4 . The experimental method developed was tested on an industrial scale in a pilot plant. The cathode metal produced was carefully washed, remelted in a H_2 atmosphere in a special furnace. The remelted Cd contained the following proportions of impurities: (%) Cu - $1 \cdot 10^{-4}$, Ni - $0.5 \cdot 10^{-4}$, Pb - $4.5 \cdot 10^{-4}$, Zn - $6 \cdot 10^{-4}$, Fe - $5 \cdot 10^{-4}$, Sb - $0.6 \cdot 10^{-4}$, Tl - $3.6 \cdot 10^{-4}$. The purity of the Cd was, thus, 99.998%. Further purification was effected by zone refining. There are 4 tables and 14 ref.

TITLE:

Investigation of the Interaction of π^+ Mesons With Carbon
at Energies of 250 - 270 MeV With the Help of a Propane Bubble
Chamber (Issledeniye vzaimodeystviy π^+ -mezonov s uglerodom pri
energiyakh 250 - 270 MeV s pomoshch'yu puzyr'kovoy propanovoy
kamery)

PERIODICAL:

Zhurnal eksperimental'noy i teoreticheskoy fiziki, 1958,
Vol 35, Nr 4, pp 899-906 (USSR)

ABSTRACT:

The interaction between pions and nuclei (especially C) has
already been investigated by a number of papers for $E_\pi < 200$ MeV
(Refs 1-4) and for $E_\pi > 200$ MeV (Refs 5-7) partly carried out
by means of a cloud chamber and partly by means of scintillation
counters. The authors of the present paper investigated the
 π^+ -C-interaction in a propane bubble chamber, which was
subjected to the action of a pion beam of the synchrocyclotron
of the Ob'yedinennyy institut yadernykh issledovaniy (United
Institute for Nuclear Research). The experimental arrangement

SOV/56-35-4-10/52

is described and shown by figure 1 . Experimental results:

1.) Elastic π^+ -C scattering: for $10^\circ \leq \theta \leq 70^\circ$ the cross section $\sigma_{\text{elast.}} = (176 \pm 16) \text{mb}$ is obtained. For the scattering nucleus the absorption coefficient is $K = 0.54 \cdot 10^{13} \text{cm}^{-1}$ and $V = 30 \text{ MeV}$, $R = 3.2 \cdot 10^{-13} \text{cm}$. The dependence $d\sigma/d\Omega(\theta)$ is shown (Fig 2). For $45^\circ < \theta < 135^\circ$ (isotropic distribution) $\sigma_{\text{elast.}} = (192 \pm 18.5) \text{mb}$, which agrees well with the diffraction scattering cross section for the above V - and K -values. 2.) Inelastic π^+ -D-scattering: Reaction: $\pi^+ + C \rightarrow \pi^+ + (N \text{ beams})(N=0,1,2...6)$, $\sigma_{\text{inelast.}} = (120^{+38}_{-19}) \text{mb}$.

A table shows the number of stars arranged according to the number of beams (separately for stars with and without mesons).

Card 2/4

SOV/56-35-4-10/52

3.) Absorption of π^+ mesons in carbon and charge exchange:
 For meson-free stars cross section $\sigma = \sigma_a + \sigma_o = (165^{+34}_{-22})\text{mb}$,
 where σ_a denotes the absorption cross section σ_o -charge
 exchange cross section. Table 2 shows the distribution of the
 number of beams in the stars for meson-free stars, in which
 connection experimental and theoretical data are compared;
 figure 5 shows the energy dependence of $\sigma_a/\sigma_{\text{nucleus}}$ for pions.
 4.) Total inelastic cross section of π^+ -C interaction:
 $\sigma_{\text{inelast}} = (296^{+38}_{-19})\text{mb}$. The authors finally thank Professor
 V. P. Dzhelepov who made it possible for them to work at the
 Laboratoriya yadernykh problem (Laboratory for Nuclear Problems),
 and they also expressed their gratitude to R. M. Sulyayev,
 Yu. A. Shcherbakov, A. I. Pilippov, and L. B. Parfenov for
 their aid in carrying out experiments, and they also thank the

TITLE: The New Antisigma Minus Hyperon Antiparticle /9

PERIODICAL: Priroda, 1960, No. 8, pp. 17 - 18

TEXT: The authors explain the classification of elementary particles into leptons, mesons and barions and the criteria for this classification. Mesons are distinguished from leptons by the fact that they can take part in strong interactions. Mesons and barions are further subdivided into charge multiplets on the basis of charge independence. Another feature of the classification is that every particle has its paired antiparticle, although in the case of the γ -quantum and the π^0 -meson, particle and antiparticle are identical. In March 1960 physicists of the Higher Energies Laboratory at the Ob'yedinennyi institut yadernykh issledovaniy (Joint Nuclear Research Institute) in Dubna discovered a new antiparticle - the antisigma minus hyperon (Σ^-). This has a mass equal to that of the Σ^- , is unstable and decays 10^{-10} sec after birth into a π^+ and an antineutron (\bar{n}) (cf. insert). For its research work the laboratory uses proton beams with an energy of up to 10^{10} electron-volts in its synchrophasotron accelerator. The

protons collide with the target in the accelerator's chamber to form high-energy π^- -mesons. Magnetic lenses and repeater magnets single out π^- -mesons with an energy of 8.3 Bev and a beam of these is fed into the propane bubble chamber under a constant magnetic field of 13,700 oersted. The liquid propane in the chamber serves as the medium in which the nuclear interactions of the π^- -mesons take place and also acts as a detector which registers the traces of the charged particles which enter the chamber or form in it. These are then filmed. The insert (facing page 17) shows the birth and decay of an antisigma minus hyperon with a key to the various trails and particles recorded on the photo. The research team at Dubna was headed by Academician V.I. Veksler (USSR) and Professor Wang Kang-chang (China) and consisted of: Wang Tau-tsien and Ting Ta-tsao (North Korea), Nguen Ting-to (Vietnam), A.K. Michul (Rumania), Kim Hi-ing (Korea), Vrana (Czechoslovakia) and the Soviet physicists N.M. Viryasov, Ye.N. Kladnitskaya, A.A. Kuznetsov, A.V. Nikitin and M.I. Solov'yev. The Polish scientist S. Otwinowski also contributed to the research. There are 3 photos and 5 Soviet references. ✓

TITLE:

Investigation of the Elastic Scattering¹⁹ of π^- -Mesons With
a Momentum of 6.8 Bev/c on Protons by Means of a Propane
Bubble Chamber

PERIODICAL: Zhurnal eksperimental'noy i teoreticheskoy fiziki, 1960,
Vol. 38, No. 2, pp 426-431

TEXT: For the purpose of making a contribution to the problems of proton
structure, the authors investigated the scattering of negative 6.8-Bev/c
pions on protons (wave length $\lambda = 0.112 \cdot 10^{-13}$ cm) in a 24-liter propane
bubble chamber placed in a magnetic field of 13,700 oe. The experimental
setup is shown in Fig. 1. The momentum distribution of π^- -mesons was de-
termined from 112 investigated tracks, and is shown in Fig. 2. The mean
momentum was (6.8 ± 0.6) Bev/c. A total of 3500 frames was interpreted, and

550 events were selected from all two-pronged stars. The measured values were processed by an electronic computer. The root-mean-square error in the angular determination was $\Delta\theta_x = 26'$ and $\Delta\theta_p = 1'14'$. The correction for track curvature did not exceed $20'$. The elastic πp -scattering events were identified by the criteria discussed here: Coplanarity (Fig. 3); angular correlation (Fig. 4); recoil proton range. Among the 550 events investigated, 218 were regarded as being elastic. Fig. 5 shows the distribution of these 218 events along the chamber axis. In the so-called effective region of the chamber (43 cm with a total length of 55 cm), 213 out of the 218 events were recorded. The distribution of these 213 events according to the azimuthal angle of the recoil proton is shown in Fig. 6. In 113 cases the recoil proton track was on top, in 100 it was below, in 115 at the left, in 98 at the right. An estimation of the percentage of quasielastic scattering events in the total number of elastic ones 6%. The cross section of the reaction investigated was found to be
